Production of constrained helical peptide(s) by linking side chains on termini of octa:peptide - derived from human immunodeficiency virus gp41 protein, useful in vaccines for treatment and prevention of infection.

Claim 11; Page 170; 279pp; English:

Peptides AAY22805-Y22917 are derived from Human immunodeficiency virus (HIV). Specifically, AAY22810-Y22910 are derived from gr41 proteins of known HV virus strains (AAY22810, AAY22810, AAY2280, AAY22880, AAY22803 represent consensus sequences of various sections of the gp41 protein). Sequences derived from the peptides are used to produce constrained helical peptides of the invention. The constrained helical peptide is produced by synthesising an octapeptide in which both terminal amino acids have a side-chain that includes a group able to form an amide

of, HIV infection, either as antifusion/anti-infection agents or

The cyclic peptides have formulas given in the specification part of which are derived from a consensus sequence of gp41 derived from HIV clades A, B, C, D, E or O. The peptides are used to cause induction of a specific immune response, resulting in antibodies that prevent virus-induced membrane fusion. The peptides are used to treat subjects with, or at risk
            residues with a difunctional linker to produce two amide bonds. The constrained helical peptides are used to treat or prevent HIV infection, especially as vaccines that generate antibodies that prevent wiral membrane fusion or infectivity. Vaccines may contain constrained helical peptides derived from several different strains of HIV. The antibodies are also useful for diagnosing HIV infection. Other uses for the constrained helical peptides are in affinity purification of ligands (particularly where complete binding protein is not readily available, e.g. replacements for protein A in immunoglobulin purification), as epitope mimics for antibody production; for isolation of synthetic antibody clones from phage display libraries, or as stable forms of
 and cyclising the octapeptide by reacting the specified side-chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV; glycoprotein; gp41; antigen; helical conformation;

preferably where associated with a carrier, as an immunogen (including as vaccine) to raise antibodies. The antibodies may be used for diagnosis or prevention/treatment of HIV infection (i.e. acquired immunodeficiency syndrome, AIDS), e.g. prevention of mother-to-child transmission or in cases of health care accidents. The peptides can be based on specific HIV strains, e.g. breakthrough isolates of HIV that have developed during vaccine trials, so a combination of them should cover a wide range of protection. The present sequence is gp41 protein from a particular HIV clade used to derive a consensus sequence of gp41. (Updated on 29-AUG-

cc antibodies that prevent viral membrane fusion, as haptens, preferably attached to a carrier, for use as an immunogen to raise antibodies that tached to a carrier, for use as an immunogen to raise attached to a carrier, for use as an immunogen to raise antibodies that cc attached to a carrier, for use as an immunogen to raise at risk of cc have a diagnostic use, as a vaccine for treatment of patients at risk of cor infected with HIV, to create combinatorial constrained helical peptide cc libraries that are useful in Chemical selection systems, to isolate the libraries for alpha-helical binding domains of known proteins, for determining whether a binding domains of known protein of proteins of peptidomimetics, to replace intact binding proteins or protein binding domains in the affinity purification of ligands, to mimic cc for the design of peptidomimetics, to replace intact binding proteins or protein binding domains in the affinity purification of ligands, to mimic cc epitopes in proteins to selectively raise polyclonal or monoclonal antibodies against such individual epitopes for isolating synthetic cc antibodies with a selected binding activity from plage display combinatorial libraries, to provide conformationally stable variants of peptides or proteins which exhibit floppy or unstable alpha-helical conformations of interest. This is the amino acid sequence of an HIV envelope protein gp41, fragments of which are used in the creation of constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine compositions for eliciting neutralising antibodies - comprising antigen containing hydrophobic sequence or having added hydrophobic material, complexed to proteosomes or bio-adhesive nano-emulsions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents HIV-1 gp160 residues 33-681 (the full protein is on the SWISS-PROT database Seq ID: 119434) used in a vaccine of the present invention. The vaccine composition is capable of eliciting contralising antibodies in a subject to a pathogenic organism which antibodies are present in vaginal secretions, intestinal secretions, lung secretions or facese. The vaccine comprisies: (a) an antigen comprising a protein or peptide having: (i) an endogenous hydrophobic material comprising a sequence of 3 to 50 non-polar or uncharged amino acids; (ii) added to the protein or peptide, an exogenous hydrophobic material comprising a sequence of 3 to 50 non-polar or uncharged amino acids or a 8-18C fatty acyl group, or (iii) both (i) and (ii), and (b) complexed with the antigen, a composition (complexed or coupled protein or peptide maintains a native structure of antigenic epitopes such that, upon administration to the subject, the antigen induces neutralising antibodies in one or more of vaginal continuations in manne response against a pathogenic organism such as a causative agent of a sexually-transmitted or mucosally-transmitted clieses, e.g. HIV infection. The compositions preserve the antigenic integrity of the protein or peptide epitopes while at the same time contains their immunogenicity. (Updated on 17-0CT-2003 to standardise OS

in a novel method for purifying HIV gpl20 so as to provide a purified gpl20 glycopeptide having protein/protein binding properties substantially identical to natural viral HIV gpl20. The method involves substantially identical to natural viral HIV gpl20. The method involves glycopylated gpl20 preparation containing full-length, glycopylated gpl20 using ion exchange chromatography so as to provide a first collection of fractions. A a fraction from the first collection is selected that exhibits specific binding affinity for CD4 peptide, thereby producing a first fractionated material. The first fractionated material is fractionated by hydrophobic interaction chromatography so as to provide a second collection of fractions from which a second collection is selected that exhibits specific binding affinity for CD4 peptide. This second fraction is fractionated by size exclusion chromatography so as to provide a third collection of fractions exhibiting specific binding affinity for CD4 peptide, thereby providing the purified gpl20 can be used for antibody production and in vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a truncated variant, designated gp140, of the Human immunodeficiency virus type 1 (HIV-1) isolate 133 envelope glycoprotein mutent g12 (see ACC43015 and ABP73112). The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for Asn) by CAG or CAA (for GIn). The mutated envelope glycoprotein polynucleotides and polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Envelope glycoprotein; HIV-1; isolate 133; vaccine; HIV infection; g12;

The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for ABT) by CAG or CAA (for Gln). The mutated envelope glycoprotein polymucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection
                                                                                                                                                                                                                                                                                                                                               Envelope glycoprotein; HIV-1; isolate 133; vaccine; HIV infection; g112;
                                                                                          Gaps

The present sequence represents a truncated variant, designated gp140, of the Human immunodeficiency virus type 1 (HIV-1) isolate 133 envelope glycoprotein mutant g14 (see ACC43021 and ABP73118). The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for ABN) by CAG or CAA (for Gall). The mutated envelope glycoprotein polymucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Envelope glycoprotein; HIV-1; isolate 133; vaccine; HIV infection; g112

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a Human immunodeficiency virus type 1 (HIV-1) envelope glycoprotein mutant. The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for A8n) by CAG or CAA (for Gln). The mutated envelope glycoprotein polymucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mutated env gene of human immune deficiency virus, useful for genetic vaccination, also derived polypeptides having asparagine replaced by

by
             describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for Ann) by CAG or CAA (for Gln). The mutated envelope glycoprotein polymucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents the Human immunodeficiency virus type 1 (HIV-1) isolate 133 envelope glycoprotein mutent 912. The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for ABN) by CAG or CAA (for Gln). The mutated envelope glycoprotein polynucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection
envelope glycoprotein mutant g112. The specification

The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of ARC or ART (for Asn) by CAG or CAA (for GIN). The mutated envelope glycoprotein polymucleotides and polypetides are used in vaccines for prevention and treatment of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a method of identifying a candidate peptide epitope which induces an HLA class I CTL response against variants of the peptide epitope, comprising identifying, from a particular antigen of an infectious agent, variants of a peptide epitope comprising primary anchor residues of the same HLA class I binding motif. The method is useful for identifying a candidate peptide epitope, which induces an HLA class I CTL response against variants of the peptide epitope. This sequence represents an HIV Env protein used in the scope of the invention.
The present sequence represents an envelope glycoprotein of Human describes mutated Virus type 1 (HIV-1) isolate 133. The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for Asn) by CAG or CAA (for are used in vaccines for prevention and treatment of HIV infection. (Updated on 23-0CT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a candidate peptide epitope, which induces a HLA class I CTL response comprises identifying variants of a peptide epitope 8-11 amino acids in length comprising primary anchor residues of the same HLA class

                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a Human immunodeficiency virus type 1 (HIV-1) envelope glycoprotein mutant. The specification describes mutated HIV-1 envelope glycoproteins that have at least two mutations at glycosylation sites, conserved among primary isolates, each consisting of replacement of AAC or AAT (for ABN) by CAG or CAA (for Gln). The mutated envelope glycoprotein polynucleotides and polypeptides are used in vaccines for prevention and treatment of HIV infection

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 29,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      43,

Vaccine compositions for eliciting neutralising antibodies - comprising antigen containing hydrophobic sequence or having added hydrophobic material, complexed to proteosomes or bio-adhesive nano-emulsions.

Claim 9; Page 22; 62pp; English.

The present sequence represents HIV-1 gp160 residues 33-681 (the full protein is on the SWISS-PROT database Seq ID: 119434) used in a vaccine of the present invention. The vaccine composition is capable of eliciting neutralising antibodies in a subject to a pathogenic organism which antibodies are present in vaginal secretions, intestinal secretions, lung

gpl20 protein; purification; fractionation; ion exchange; chromatography; binding affinity; CD4; hydrophobic interaction; size exclusion; vaccine.

Human immunodeficiency virus 1.

immunodeficiency virus type I (HIV-1) isolates. These proteins are used in a novel method for purifying HIV gp120 so as to provide a purified gp120 glycopeptide having protein/protein binding properties gp120 glycopeptide having protein/protein binding properties substantially identical to natural viral HIV gp120. The method involves fractionating a crude gp120 preparation containing full-length, gp120 using ion exchange chromatography so as to provide a first collection of fractions. A a fraction from the first collection is selected that exhibits specific binding affinity for CD4 peptide, thereby producing a first fractionated material. The first fractionated material is fractionated by hydrophobic interaction chromatography so as to provide a second collection of fractions from which a second collection is selected that exhibits specific binding affinity for CD4 peptide. This second fraction is fractionated by size exclusion chromatography so as to provide a third collection of fractions exhibiting specific binding affinity for CD4 peptide. This affinity for CD4 peptide, thereby providing the purified gp120. The purified gp120 can be used for antibody production and in vaccines. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               238
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       150

immunogenic fragment of an ancestor or COT protein for inducing an immune response in a mammal and a method for preparing an ancestral or COT viral amino acid sequence. The composition and methods are useful for diagnosing, preventing or treating viral (e.g. HIV) infection. The invention is also useful in gene therapy. The present sequence is a clade most recent common ancestor (MRCA), COT least squares (LScot) and COT minimum of means (MMCot) reconstructions for the clade B env gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                       182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence; or an ancestral hiving source or an ancestral viral gene sequences and ancestral viral gene sequences and ancestral viral gene sequences and ancestral viral protein sequences for highly diverse virtuses, such as HIV-1. The methods use samples of circulating viruses to determine an ancestral viral sequence by maximum likelihood phylogeny analysis. In the present case, the ancestral HIV-1 subtype B env sequence (see AAH5646) was determined using 3 subtype B sequences; (obtained from 9 different countries) and 3 subtype D (outgroup) sequence. The distances between this ancestral viral sequence and circulating strains used to determine it were on average 12.3% (range: 8.0-21.0%) while the available specimens were 17.3% different from each other (range: 13.3-23.2%). Thus, the circulating virus than to any other variant. The ancestral gible sequence circulating virus than to any other variant. The ancestral gible sequence included a wide variaty of immunogenically active peptides when processed for antigen presentation; nearly all known subtype B CTL epitope consensus amino acids were represented. Thus, an immunogenic composition contents and each other sequences and will also elicit to this subtype B ancestor protein will elicit broad neutralising antibody against HIV-1 isolates of the same subtype, and will also elicit can broad cellular response mediated by antigen specific T-cells. A claimed vaccine composition comprises a viral ancestor protein or its immunogenic fragment, especially one derived from the HIV-1 group M subtype B gp160 ancestral protein. group M, subtype B, ancestral envelope protein (env).

19-MAY-2005 (first entry)

HIV-1

or eukaryotic cell transformed or transfected with the expression construct; a composition for inducing an immune response in a mammal comprising a highly diverse FIV ancestor protein or its antigenic fragment; a method of preparing an FIV viral amino acid sequence; a method for inducing an immune response to FIV in a host; a method for making an PIV vaccine; a kit comprising a composition comprising an ancestor protein or an antigenic fragment of an FIV ancestor protein and instructions for administering the composition to a subject; and a method for detecting infection with FIV. The ancestral feline immunodeficiency virus (FIV) nucleic acid sequence is useful in preparing a vaccine against FIV. This is the amino acid sequence of ancestral HIV-1 group M subtype B envelope (env) protein. 8 \times 9 \times 9

Sequence 883 AA;

```
sequence and its fragment, where the sequence is a determined founder sequence of a highly diverse viral strain, subtype or group of an endogenous retrovirus. Also included are an isolated ancestor protein (or its fragment) from an endogenous retrovirus, an isolated expression construct (comprising the following operably linked elements: - a construct (comprising the following operably linked elements: - a construct (comprising the following operably linked elements: - a correction and a transformed or transfected with the protein construct, a composition for inducing an immune response in a recipient construct, a composition for inducing an immune response in a recipient construct, a composition for inducing an immune response in a recipient construct, a composition for inducing an immune response in a recipient construct, a binds specifically to an endogenous retrovirus ancestor protein (and that binds specifically to a plurality of circulating descendant endogenous retrovirus ancestor proteins), a method of corporating an ancestral endogenous retrovirus anno acid sequence, a method for inducing an immune response to a donor virus in a transplant recipient or a potential transplant recipient, a method of matking a construct or a preparing an endogenous retrovirus an endogenous retrovirus and end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and method for performing sentituding in a subject. The ancestral viral nucleic acid sequence is of Porcine Endogenous Retrovirus (PERV) subtype A, B or C and has at least 70% identity with sequence of any of the 18 nucleotide sequences fully defined in the specification. The sequence may also be optimized for expression in a human host. The nucleic acid sequence or its fragment is useful in the prophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   factors commonly associated with viral activation, e.g. immune suppression, graft versus host disease, graft rejection, viral co-infection, and cytotoxic therapies. The present sequence is an ancestral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     viral infection in transplantation that is heightened by the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated ancestral viral nucleic acid sequence that is a determined founder sequence of a highly diverse viral strain, subtype or group of endogenous retrovirus, useful in the prophylaxis of viral infection.
                                                                                                                                            Xenotransplantation; vaccine; acquired immune deficiency syndrome; anti-hiv; immune disorder; HIV-1 infection; infection; PERV infection; diagnosis; graft versus host disease; immunosuppressive;

The invention relates to an ancestral or center of tree (COT) viral nucleic acid and amino acid sequences that are determined founder sequences of a highly diverse viral strain. The invention also relates to a composition comprising a highly diverse viral ancestor protein or an immunogenic fragment of an ancestor or COT protein for inducing an immune response in a mammal and a method for preparing an ancestral or COT viral amino acid sequence. The composition and methods are useful for diagnosing, preventing or treating viral (e.g. HIV) infection. The invention is also useful in gene therapy. The present sequence is an ANI-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              643
